

15 April 2010

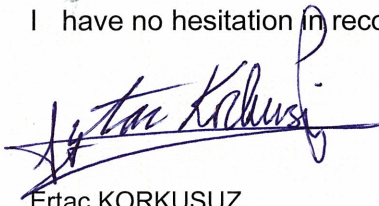

To whom it may concern,

*Surface Removal Specialists* have a standing contract with Qenos Olefines Plant at Botany Industrial Park SYDNEY for the provision of services which include surface removal and corrosion removal, particularly the treatment of under lagging corrosion. *SRS* have been performing this task above expectations all over the Botany Industrial Park for just over two years. The businesses also include Alkatuff, Alkathene, Site Utilities, Huntsman and Chlorine.

*Surface Removal Specialists* use specialized equipment which incorporates a low pressure sand blast system which is the most environmentally considerate system we have viewed to date as it has a small water component which absorbs the dust particles and when combined with low pressure and the very small usage of media (75 kilos per hour), produces a very effective environmentally considerate paint and corrosion removal system. Encapsulation is kept to a minimum and cleaning up is quick and easy which equates into considerable financial savings. The low pressure has been very useful when treating corrosion on live line pressure pipes and vessels and is very effective in confined spaces as low visibility due to dust is not an issue in the majority of cases.

During their time on site the operators employed by *Surface Removal Specialists* have achieved our very high standards in safe work and environmental procedures. I consider their work ethic is very professional, supportive and caring for the work environment.

I have no hesitation in recommending *Surface Removal Specialists*.
